

EducatorData.com

A Discourse on Web App Improvements

Dan McHugh
dan_mch@outlook.com

4 Quick Hits

Modifying four aspects of the Web App will:

1. Improve speed to insight
2. Improve insight to value realisation
3. Reduce noise in the App
4. Help identify and drive community involvement

Personas

Customer Journeys (JTBD)

Remove Dashboards from current landing page

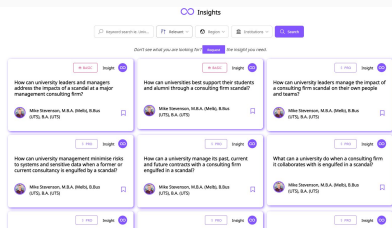

Bring “view” of voting out of Pro

Idea 1: Addition of Personas to App

Detail of proposed change

Current state:

EducatorData.com funnels customers to explore insights through a “wall” of content blocks.

Proposed future state:

EducatorData.com adds a search filter or specific landing page (based on desired persona) to allow faster surfacing of contextually accurate insights

Expected impact

- Subscribers identify themselves as a specific community, eg:
 - Chancellor
 - CFO
 - COO
 - Registrar
 - Director of Research
 - Marketing & Communications
 - DEI Leads
- Drives more relevancy to insights being written/produced
- Potential for higher utilisation of EducatorData.com platform as users can visualise more content applicable to them
- Over time, allows for further marketing or customer success outreach when new insights become available → driving return visits and improved value
- Faster speed to insight and speed to value
- Flywheel for internal metrics on what personas are driving usage → allowing course correction or leverage

Internal factors to consider

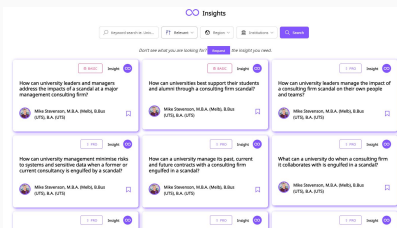

- Platform flexibility to add this feature
- Community/User perception → is anonymity seen as a benefit in this situation
- Additional time required to tag insights as they are created → adds another level of review

Idea 2: Customer Journeys to drive repeat visits

Detail of proposed change

Current state:

EducatorData.com funnels customers to explore insights through a “wall” of content blocks.

Proposed future state:

EducatorData.com adds landing pages or sections of the site to specific decisions a user is trying to make (combination of Jobs to be done and Personas)
Eg: Registrar needs to set org structure for her team to better capture mature students

Expected impact

- Subscribers define their journey based on the problem they are trying to solve. This may start off generally and over time increase in either complexity or narrowness of focus based on maturity of ask
- Insights begin to build on each other so they have increasing intrinsic value to a user as they walk through their problem. Problems become less binary (question/answer) and more of a stewardship towards an **outcome**
- Example: *Help me improve research funding and business collaboration post COVID-19*
- Leverage existing Insights such as statistics on funding, structure or benchmark of major Australian /International Higher Ed Institutions in this space, examples of programs that these Institutions have rolled out >> However place them in a journey.
 - **Start Here:** What is the state of research funding in Australia
 - **Next:** How are Australian Institutions Structured
 - **Next:** How have others solved this challenge

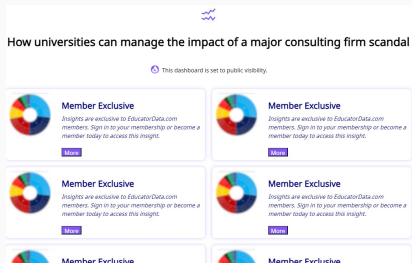

Internal factors to consider

- Platform flexibility to add this feature
- Large uplift in the way Insights are presented to users. May impact volume of insights being processed
- Inability to cover “every” journey. Some strategic work to identify what are the most popular/impactful journeys users want to solve for

Idea 3: Remove dashboards from landing page

Detail of proposed change

Current state: Member Dashboards for Free Users are empty/inaccessible

Proposed future state: Remove all together or provide a mock example of a dashboard to showcase the functionality, rather than presence of.

Expected impact

- Reduce noise on the Platform → Users trying to work out “how” a dashboard would benefit them (it’s a Pro feature) but not really being able to see how they work.
- Dashboards are a user’s way of creating their own “Customer Journey”. While flexible, it leads to bloat and is difficult to replicate for all users
- The intended journey for Free users to Pro users can be achieved via a video scenario → Data is important so you don’t want to share in Free mode, but showing Free users “how” they can leverage the platform and “what” problems they can solve will drive better conversion than “features”

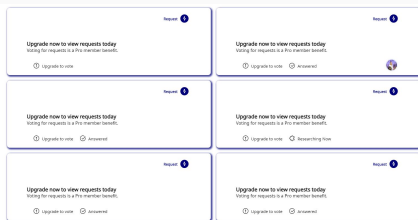

Internal factors to consider

- None - fairly simple task to remove this view for free users

Idea 4: Bring view of voting out of Pro and into Free

Detail of proposed change

Current state: Free Users are greeted with a black wall of insights being voted on

Proposed future state: Allow a view into what is being voted on and what the broader community is asking. Fostering transparency and a path for Free users to see what they are missing out on

Expected impact

- This is the second “feature” that is walled off from Free users from a content perspective, potentially hampering their path to becoming a Pro user.
- Seeing what the community is voting on provides transparency into the community (fosters trust which will be useful when asking for increased subscription fees)
- Seeing what is being “researched” vs “answered” shows Free users the velocity of change/new content on EducatorData.com → Freshness = improved trust and some FOMO
- Free users can identify with the Pro User asking a question (same persona or journey) which can drive conversion

Internal factors to consider

- None - simple task of opening up views of what is being voted on - not the answers

Potential structure for sustained customer usage and user growth
